

How to implement software project successfully

Choosing the right consultants

Similar to the projects implemented software solutions successfully; your company wishes it is also successful like that. BFO implementation methodology means a tight combination with your implementation partner or local partners, they are specialists who conversant with business process and the process needing improvement (not to be limited security regulation) to carry out the solution. The implementation partners/ local partners have experienced in professional skills and technology; they will penetrate your practical requirement. It is the reason why BFO combines with native partners, trains them to understand advanced technology of BFO. They will use BFO solution and apply exactly to your own company specific requirements. At present there is not any solution supplier which has the advanced implementation methodology as BFO. So finding the right implementation partner ensure that they will help you implement successfully software project.

Avoiding inexperienced consultants

At first, we assert that choosing incorrect consultant is rather popular. Because according to Standish Group, a company researching about IT, there is only 28% successful implementation software project as expectation, 3/4 remainder fails as time of deployment longer or the narrow project range or increasing cost. How to avoid failure?

The most case of failure as time of deployment take longer than expectation, so when seeing the implementations they need let you know the experience as well as any difficulty of the project they deployed and the implementation method as well as their solutions.

Reducing risk

If the first appointment only care for the product features, it means that you are finding the risk result. It is a pity that it is a popular method to choose the solution. All consultants present easily the product feature. To notice that they are specialist and their works is implement project. When you work with them they will transfer to you the feature table of the product, the project scope compared with the similar feature table. The consultants only demonstrate details of features as you appoint.

According to Standish Group, average feature of current products meet 74%. Average budget exceeds 214% and time for project exceeds 202%.

Stagnated business activity will make you meet more obstacles.

Rejecting unnecessary features

Secondary, unnecessary features will not be included into the first period of project. These miscellaneous features sometimes make you consume resource and grow excessively the project about range, human resource, and unnecessary cost, while important features are influenced by lacking of resource.

Implementation methodology “transfer technology” of BFO

Transfer Business Logic Source Code

BMI will train BFO technology to local partners and transfer Business logic source code about handling professional so that they can customize or develop yourself add-on solutions unlimitedly. All of your company’s specific requirements will be handled easily in the future, when needing more features, the company’s local partners will control easy completely that not depend on the supplier.

these developed features will have regulation to name privately so that when the company needs upgrade new versions, these features are still used.

Focusing on key main requirements

Success is due to our advanced methodology, as concentrating on the most key main requirements of businesses. The stage of “diagnostics” plays an important role to find out these key main requirements and rejects unimportant requirements that can influence the project. In this stage, the local partners will collect and analyze necessary requirement and show suitable solution for business concurrently show the time, budget as well as exact human resource of the project. It needs the cooperation of responsible department and specialist of BFO implementers to design solution as improve business processes together.

Potential benefit

In this diagnostic stage, the responsible departments work together with BFO specialist to analyze, design processes and enter into system. The purpose is to confirm the requirement and range of the project. However the experience showing that this work brings further benefit, it helps enterprises improve business process, solve remained unreasonable points, reduce risk, cost and time for enterprise. Even though you choose other solution, these standardized processes still can use. However, there are 90% enterprises that are ready and self confident to deploy BFO solution together with their own local partners.

Real solution you require

Practically, when transferring this methodology, BFO also transfers other specialized experience about implementation skill ... highly experiences are learned from many successful projects. So you will be ensured that designed solution will be the real solution you will get and user will realize it.

Unlike as other academic approachable method which many consultants use it to enter into ‘ideal’ business model, technology transferring methodology of BFO is based on practical. It is analyzed, designed by local partners and applied, suitable to specific requirement of enterprise.

Safety

As you know choosing consultant is very important, and other importance is transferring the feature of product. However, the enterprise should choose high professional consultant as well as good solution to reach the target safety. Technology transferring

methodology of BFO supplies to enterprise both of them. It also supplies you with a real software solution what you want, streamline the progress so that the project in time and within budget in the safe way.

Briefly, in order to solution being right with your requirement, please contact with BFO or certified agents of BFO, they are experts in both business practice and technology along with BFO transferring methodology, they will handle implementation problem. And being sure that, with BFO, the solution you need is solution that you get in time and within your budget.
